MIS 310 – HTML

Hyper Text Markup Language

- Describes structure (semantics)
 - Elements and Attributes
- Tags label content so browsers know how to render it
- XHTML 2.0 vs. <u>HTML5</u>

I am learning about HTML

HTML Element

HTML Attribute

Attributes are name = value pairs.

ams

HTML Page

```
<!DOCTYPE html>
                          <!DOCTYPE html>
<html>
                          <html lang=en>
<head>
                                <head>
</head>
                                </head>
<body>
</body>
                                <body>
</html>
                                </body>
                          </html>
```

Two basic parts of web pages: head & body

HTML Page – Head

```
<head>
<head>
<meta charset="utf-8">
<title>Geoff's Page</title>
k rel="stylesheet" href="css/g.css"
<script src="js/gms.js"
</head>
```

Standardize subfolders e.g.: images, scripts, styles, docs

Nesting

I like winter, spring, and fall

summer <i>best</i> of all.

Text would display as:

I like winter, spring, and fall But, I like summer **best** of all.

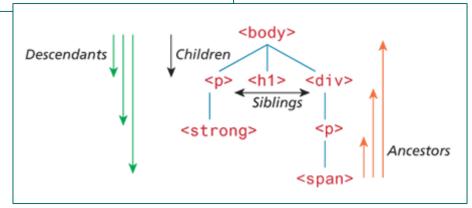

This would be incorrect: <i>best</i>

Document Object Model (DOM)

```
<body>
    This is some <strong>text</strong>

    <h1>Title goes here</h1>
    <div>
        This is <span>important</span>

        </div>
</body>
```

Images from Fundamentals of Web Development (2nd Edition) by Randy Connolly and Ricardo Hoar

Semantic Markup

- Avoid Presentation Markup
 - Let CSS take care of how things look
- Use HTML to describe the content's structural semantics and not how to visually present it
- Why?
 - Maintainability
 - Performance
 - Accessibility (link)
 - Search Engine Optimization (SEO)

HTML Validation

https://validator.w3.org/
